T6 Series AC Servo Driver

T6 AC Servo Driver

T6 Series AC servo products are a cost-effective AC digital servo drive which is designed mainly for position high accurate control, power range up to 1kw, which can provide intelligent performance with efficient configuration methods.

Combined with abundant features such as MFC, vibration suppression, Multi-mode filter function etc., it provides machines a Compact size, low tuning works, high resolution encoder up to 23 bits ,which can be used for high accuracy applications

Features:

- ◆ Space Vector Modulation (SVM) Technology
- ◆ Efficient configuration methods: 2 parameters related, robust Control
- ◆ Automatic identification for motor type with 17bit/23bit encoder
- ◆ Variety of external command signal: Pulse&Direction
- ◆ Build-in motion engine, internal motion controller used
- ◆ P-N Junction: Exchange power of entire servo drives
- ◆ Encoder output function

Talent Functions

| |
|--|
| Inertia ratio identification |
| Off-line inertia ratio identification, better performance, easy tuning |
| Position mode/Velocity mode |
| Supported Position mode/Velocity mode/Torque mode <ul style="list-style-type: none"> Position mode: Profile position/Pulse & direction/Built-in position/RS232/RS485 Velocity mode: Profile velocity/Built-in velocity/RS232/RS485 |
| Control mode switching |
| IO signal for mode switching, select Position mode/Velocity mode |
| Gain switching |
| Automatically switch gain under special conditions/ IO signal for gain switching |
| 16 path build-in position mode/velocity |
| No analog control required. Execute by digital IO signal or RS485 |
| Command pulse inhibition |
| Invalid the pulse input, stop with deceleration |
| Limit switch |
| Protective equipment operation |
| Programmable Inputs and Outputs |
| <ul style="list-style-type: none"> 4 programmable digital inputs 3 programmable digital outputs (2 single-ended, 1 differential) |
| Encoder signal output |
| Output encoder signal: Single-ended /Differential |
| Speed zero clamp |
| If the actual analog input is less than the setting value, the motor will stop rotating in servo-on condition |
| Vibration Suppression |
| Specific resonance frequency can be obtained from PC upper computer software according to waveform monitoring, and filter frequency can be set to effectively suppress the oscillation ripple of a certain frequency in the current instruction. |
| Command filter |
| To make the positional command divided or multiplied by the electronic gear smooth, set the command filter |
| Friction torque compensation |
| Apply feed forward torque superposition directly to torque command |

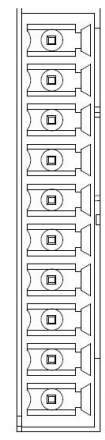

Connectors and Pin Assignment

| Port | Function |
|------|-----------------------------------|
| CN1 | Pulse + Direction Signal Port |
| CN2 | Digital input/output Port |
